Excerpt: . . . risk of infection. Many studies investigating antibiotic-resistant bacteria and their impact on human health combine epidemiologic studies with molecular subtyping - also called DNA fingerprinting - a technique that translates bacteria's genetic material into a bar code that can be used to identify specific pathogens and link them with disease outbreaks. For example, following an outbreak of a diarrheal disease among people in a community, an epidemiologic study would determine all the common exposures among the people with the disease, and molecular subtyping of bacterial isolates could determine what pathogens were responsible for the disease. While the use of antibiotics in animals poses potential human health risk, its use of antibiotics in is also an integral part of intensive animal production in which large numbers of poultry, swine, and cattle are raised in confinement facilities. ( See fig. 1. ) Antibiotics are used in animals to treat disease; to control the spread of a disease in a group of animals when disease is present in some of the animals; to...
